# **1. INTRODUCTION**

The Wagga Wagga Urban Salinity Technical Report 2017/18 is a summary of data collected from Councils' urban salinity piezometer network and dewatering bores. The report is a move away from the annual Urban Salinity Status Report format which contains a more holistic reporting approach to impact, attributing factors, monitoring networks and management plans regarding urban salinity in the Wagga Wagga LGA.

The Urban Salinity Technical Report contains results from the groundwater monitoring network for that reporting period, being published annually.

## **1.1 Annual Changes in Overall Standing Water Levels**

For a broader interpretation of groundwater conditions, comparing annual groundwater conditions on a local scale can be done by presenting overall SWL results as a percentage of total piezometers measured. Changes in groundwater conditions (ie, SWL increase, decrease, stable and dry) are revealed when compared to previous years' data.

Figure 1 shows annual changes (as a percentage) in SWL for all piezometers in the Wagga Wagga LGA for annual reporting periods between 2005/06 – 2017/18. For example, of the two hundred and two piezometers measured during the 2017/18 reporting period, 52% showed a decrease in SWL when compared to the previous years' readings, 12% increased in SWL, 31% were dry and 5% remained stable. This allows for overall trending of groundwater conditions for the region based on all piezometers recorded.

It can be seen that from 2006/07 to 2010/11 there was a quite steep rise in SWL increase (from 13 - 67% of all piezometers respectively), coinciding with a decline in both SWL decrease (33 - 7%) and piezometers in a dry state (37 - 26%). Following this period, from 2010/11 to 2014/15, there was a steep declining trend in SWL increase (from 67 – 13%), coinciding with an inverse increase in SWL decrease (from 7 – 50%).

For the current reporting period (2017/18), overall piezometers showing a SWL increase dramatically dropped, reversing a recent trend, from 13 - 54% when comparing results from 2014/15 to 2016/17 to 12% in 2017/18. The majority of these piezometers migrated to a SWL decrease change, increasing from 9% to 52% of all piezometers, when comparing the previous reporting period.

### Standing Water Level (SWL) Changes in the Wagga Wagga LGA Piezometers 2005/06 - 2017/18 (%)

**Figure 1:** Graph depicting annual change in overall piezometer readings as a percentage of all piezometers in the Wagga Wagga LGA.

## **2. RAINFALL AND EVAPORATION**

Groundwater recharge is significantly affected by the amount of rainfall relative to evaporation. Low rainfall combined with high evaporation rates are expected to result in a fall in the water table. This occurs as insufficient water is available to saturate the upper soil profile and infiltration into the groundwater system is prevented. Alternatively, high rainfall will saturate the soil profile allowing for infiltration to groundwater. This infiltration is increased in areas where clearing of deep rooted vegetation has occurred.

The Bureau of Meteorology field station at Forest Hill, Wagga Wagga recorded historical averages and annual monthly rainfall and evaporation data during the period from July 2017 to June 2018 (Figure 2).

The 2017/18 reporting period in Wagga Wagga recorded 510mm of rainfall, a decrease of 89mm compared to 2016/17 total of 599mm. This figure represents a 10% increase on historical average rainfall (569mm). Monthly rainfall averages exceeded historical monthly rainfall figures on only three occasions during 2017/18, with a major rainfall events occurring in December. Nine months in 2017/18 saw below average rainfall.

The 2017/18 reporting period in Wagga Wagga recorded 1939mm of evaporation. This figure is 4% higher than historical averages of 1862mm, and an increase from the 2016/17 reporting period evapotranspiration total of 1802mm.

### Long Term versus Short Term Rainfall and Evaporation Data for Wagga Wagga

Figure 2: Monthly rainfall and evaporation graph for Wagga Wagga 2017/18.

### 3. MONITORING PROGRAM

Piezometers located throughout the Wagga Wagga Local Government Area are maintained by Wagga Wagga City Council to monitor urban salinity. Established in 1998, the current monitoring network consists of 202 active piezometers (Figure 4). The piezometers were monitored on a monthly, bi-monthly or quarterly basis to examine trends, identify causes of the problem and potential risks areas.

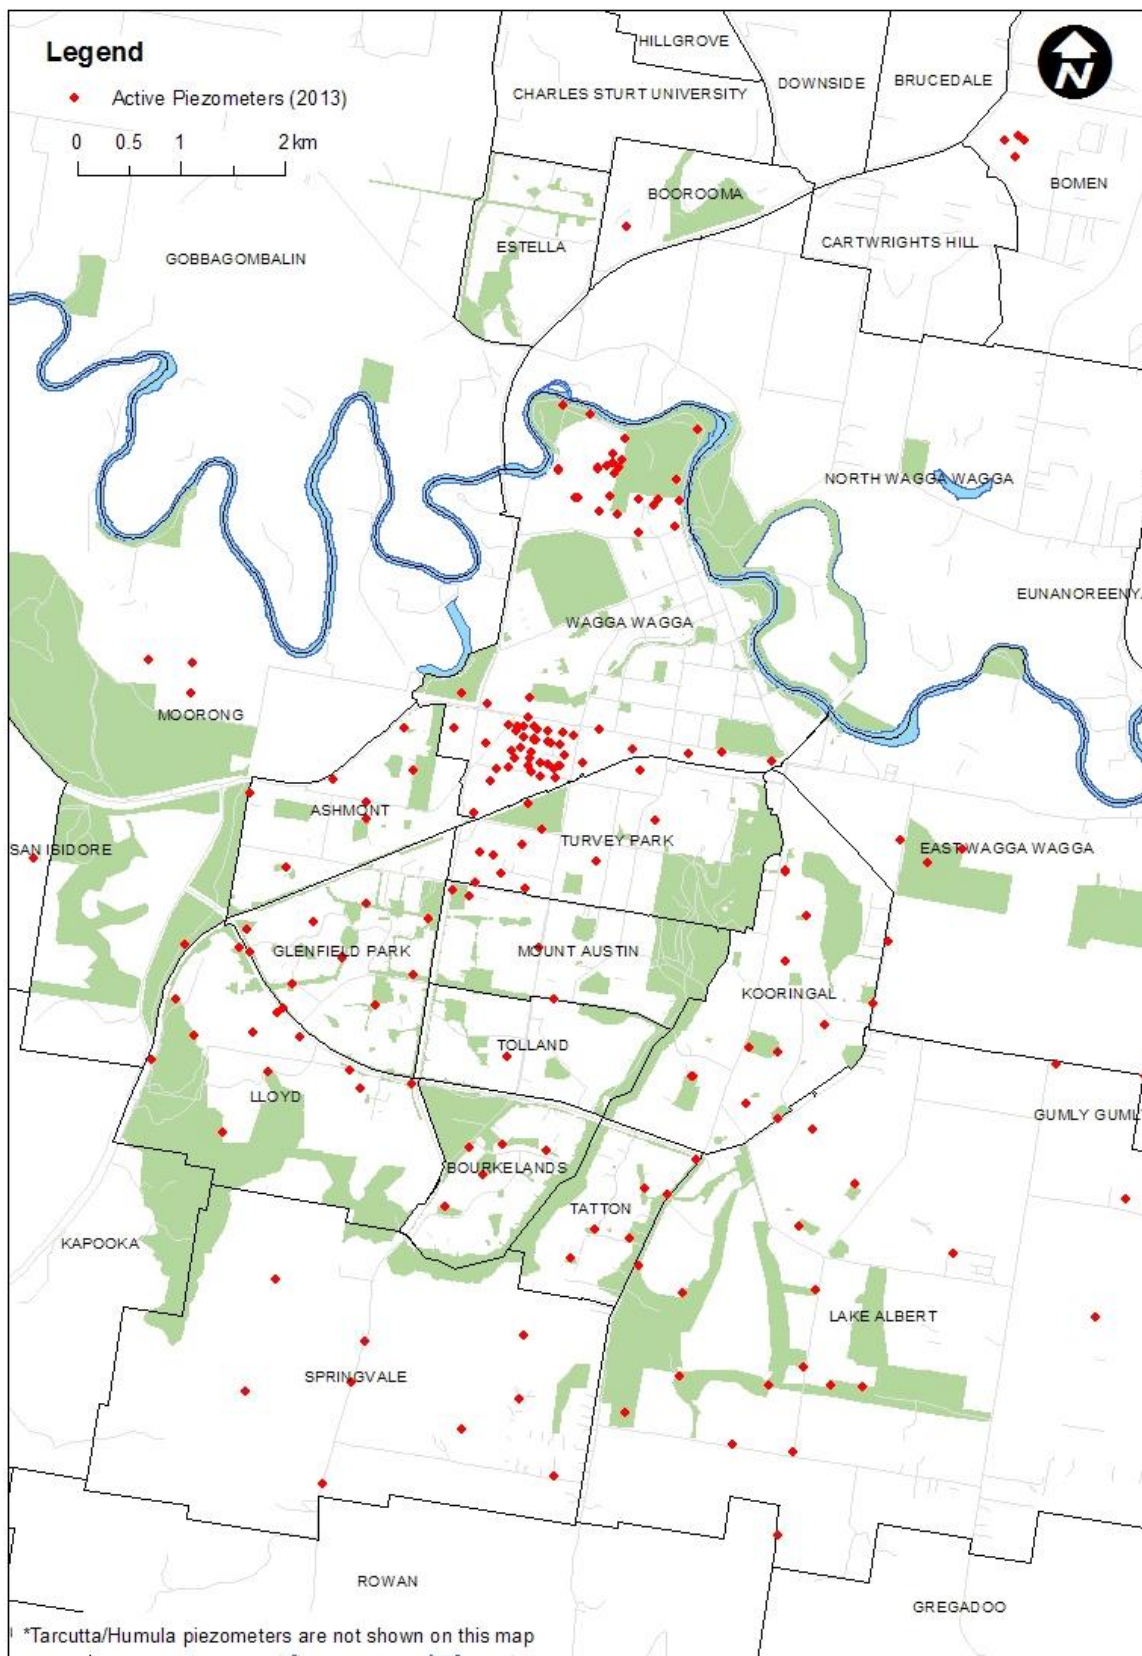

Standing water level (SWL) and electrical conductivity (EC) readings are collected and used to monitor urban salinity. The SWL is measured in metres below the ground surface to the nearest centimetre using a water level meter. Measurements are taken from the height of the piezometer casing and the height of the extension subtracted from the reading. Piezometers at ground level do not require a subtraction. Water is extracted from the piezometer using a bailer to measure for EC. The EC is measured in decisiemens per metre (dS/m) to two decimal places using a handheld conductivity meter (Figure 3).

**Figure 3:** Measuring standing water level (left) and electrical conductivity (right) of groundwater.

Results of groundwater monitoring identify areas susceptible to saline discharge and monitor the effectiveness of Council's preventative and remedial measures.

**Figure 4:** Location map of Wagga Wagga City Council's piezometer monitoring network

## 4. **RESULTS**

### 4.1 **Standing Water Levels**

The results discussed in this report relate to the change in the depth to the water table (standing water level) for all piezometers in the Wagga Wagga Local Government Area from July 2017 to June 2018 in relation to the results from the previous reporting period (July 2016 – June 2017).

To allow for meaningful interpretation of the data piezometers are grouped into eleven categories. Nine categories are based on the major sub-catchments identified by Golder (2007). Two additional groups (Undefined and Tarcutta/Humula) have been added to accommodate for piezometers outside the area recognised in the Golder (2007) study.

The eleven piezometer categories are:

- 1. Mid Murrumbidgee Alluvium (MA).** Thirty four piezometers are located in the Mid Murrumbidgee Alluvium piezometers 1, 62, 72-76, 79-81, 105-116, 118, 120-127, 144-146, 164-166, 171, 177, 210 and 211 (old Bore 9). These piezometers are associated with the Narrung Street Sewage Treatment Plant, the disused Wiradjuri Landfill and the northern section of the Calvary hospital precinct.
- 2. North Western Sub-catchment (1).** Three piezometers 189-191 are located in the newly developed rural residential estate known as Riverview.
- 3. Far Western Sub-catchment (2).** Ten piezometers are located in the Far Western Sub-catchment piezometers 18, 41, 54-55, 143, 174-175 and 199-202. The Far Western Sub-catchment piezometers incorporate areas of the suburbs of Ashmont, Glenfield and four recently drilled piezometers in Lloyd West
- 4. Western Sub-catchment (3).** Forty one piezometers are located in the Western Sub-catchment piezometers 2-3, 6-7, 9-15, 17, 34, 37-38, 40, 42-44, 47, 56-57, 128, 142, 147, 152, 172-173, 178-179, 185-188, 197-198 and 203-209. These piezometers are located in the suburbs of Ashmont, Turvey Park, Mt Austin, Lloyd, Glenfield, Tolland, central Wagga Wagga, Bourkelands and seven recently drilled piezometers in Lloyd West.
- 5. CBD Sub-catchment (4).** Forty one piezometers are located in the CBD Sub-catchment piezometers 5, 16, 19-21, 39, 58-61, 63-69, 70-71, 78, 80, 82-90, 99-104, 176, 196, 1/1, 1/2 and 1/3. These piezometers are located in the Calvary hospital precinct and central Wagga Wagga.

- 6. Eastern CBD Sub-catchment (5).** Three piezometers are located in the Eastern CBD Sub-catchment piezometers 91-92 and 195 are situated in the suburb of Koorungal.
- 7. Far Eastern CBD Sub-catchment (6).** Three piezometers are located in the Far eastern CBD Sub-catchment piezometer 50 and 192-193. These piezometers are found in east Wagga.
- 8. Eastern Sub-catchment (7).** Forty six piezometers are located in the Eastern Sub-catchment piezometers 23-31, 36, 45, 48-49, 51, 53, 93-98, 129-140, 153-163, 170 and 180-184. The Eastern Sub-catchment is the largest catchment and incorporates the suburbs of Koorungal, Lake Albert, Glenoak and Springvale.
- 9. Far Eastern Sub-catchment (8).** Three piezometers are located in the Far eastern Sub-catchment piezometers 167-169 situated in the suburb of Lake Albert.
- 10. Undefined (O).** Seven piezometers are grouped within the undefined category as they fall outside the major Sub-catchments defined by Golder (2007). Piezometers 22, 32, 33, 148-151 are located at San Isidore, Forest Hill, Boorooma and Bomen.
- 11. Tarcutta/Humula (T/H)** contains the seven piezometers installed in the villages of Tarcutta and Humula (piezometers T1-T6, H1-H2).

Names given to the major sub-catchments by Golder (2007) Mid Murrumbidgee Alluvium, CBD sub-catchment, Western sub-catchment and Eastern sub-catchment formed the basis of names for the piezometers categories.

The change in standing water level for all piezometers is presented in

Table 1. The Table illustrates the number of individual piezometers recorded in each piezometer category per group during 2017/18. A discussion of each group can be found in subsequent sections of this report.

**Table 1:** Changes in standing water levels across piezometer categories 2017/18

<b>Change in SWL Category</b>	<b>MA</b>	<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>6</b>	<b>7</b>	<b>8</b>	<b>T/H</b>	<b>O</b>	<b>Total in Category</b>
SWL Increase	3	0	2	5	5	0	0	6	2	0	2	<b>25</b>
SWL Decrease	18	3	4	26	22	2	2	19	0	7	2	<b>105</b>
SWL Stable	2	0	2	1	0	0	0	4	0	0	1	<b>10</b>
Piezometer Dry	15	0	2	9	13	1	1	17	1	1	2	<b>62</b>
<b>Total Piezometers</b>	<b>38</b>	<b>3</b>	<b>10</b>	<b>41</b>	<b>40</b>	<b>3</b>	<b>3</b>	<b>46</b>	<b>3</b>	<b>8</b>	<b>7</b>	<b>202</b>

The change in SWL for each piezometer category during 2017/18 is presented in Figure 5.

The dataset shows that the greatest number of piezometers, one hundred and five (52%), have decreased in standing water level (SWL) when comparing SWL change between 2016/17 and 2017/18. Twenty-five (12%) recorded an increase in SWL with sixty-two (31%) piezometers remaining dry, during the reporting period. Ten (5%) piezometers remained stable (those with an increase/decrease of 5cm or less).

Piezometers that contained water in the previous year that are now dry have been included in the 'SWL decreased' category, whereas piezometers that started as dry but now contain groundwater have been included in the 'SWL increased' category. These results were omitted from average increase/decrease calculations. Graphs of individual piezometers containing groundwater have been placed in Appendix D.

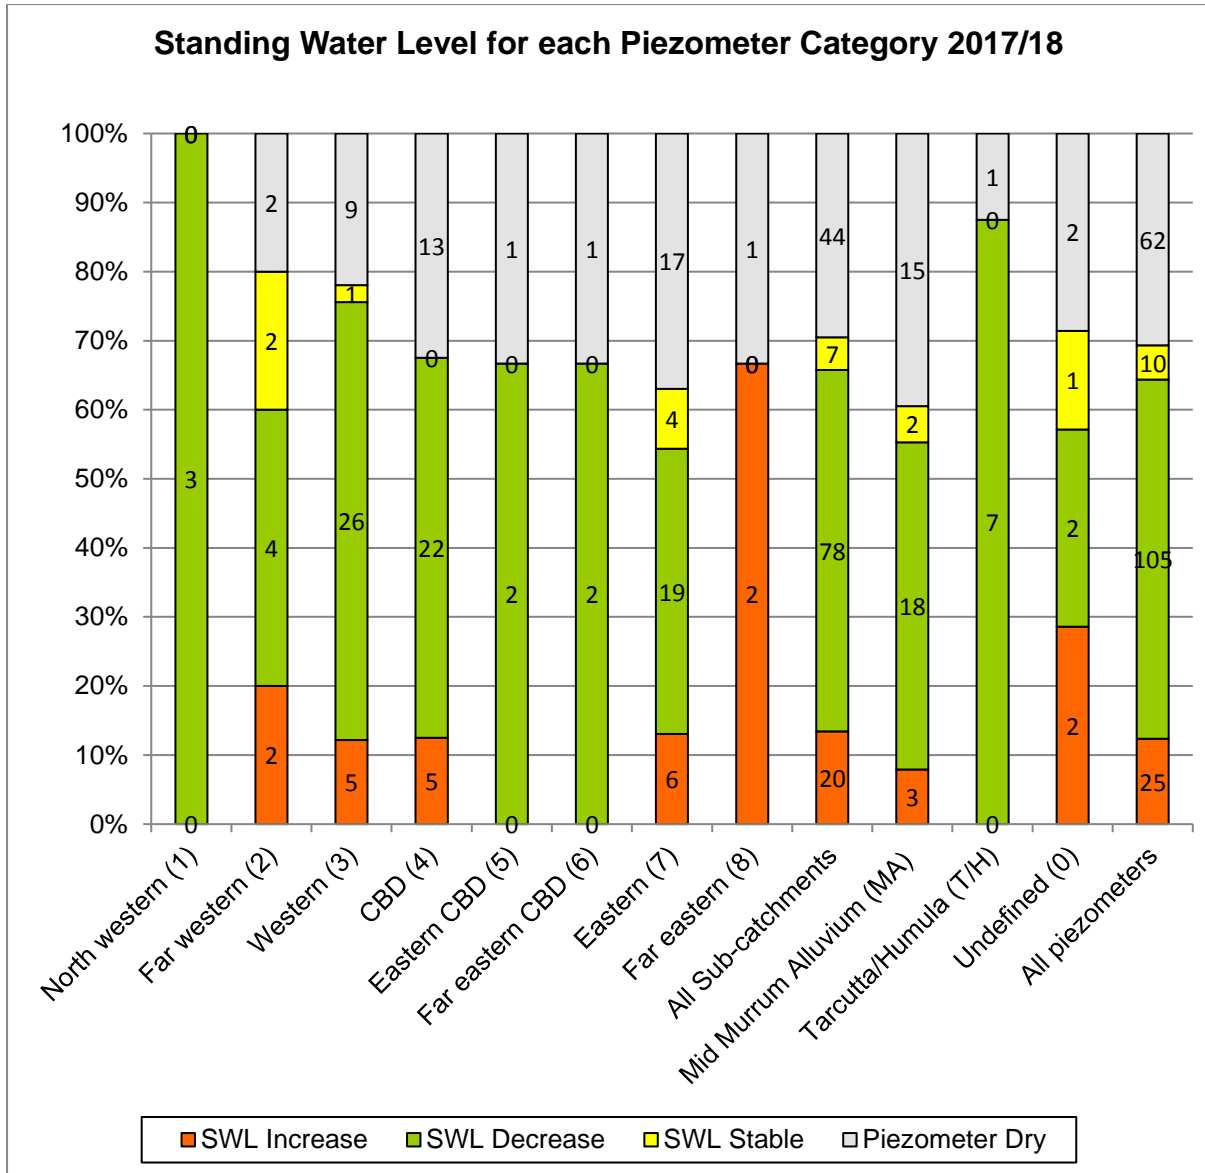

Figure 5: Chart depicting change in Standing Water Levels for each piezometer category

**Mid Murrumbidgee Alluvium**

The Mid Murrumbidgee Alluvium is the fourth largest piezometer category and contains 34 individual piezometers. Eighteen of the piezometers located in the Mid Murrumbidgee Alluvium decreased in SWL for the reporting period. Fifteen piezometers remained dry, with only three experiencing a increase in SWL.

Mid Murrumbidgee Alluvium (MA)			
Increased	3	18	Decreased
Average	2.23	-1.00	Average
Maximum	4.01	-3.24	Maximum
Minimum	1.29	-0.06	Minimum

Piezometers increasing in SWL recorded an average increase of 2.23m. The piezometer with the greatest increase in SWL is located in Gormly Ave. Decreasing piezometers decreased by an average of -1.00m. The greatest decrease in SWL was recorded at Narrung St.

### North Western Sub-catchment

Three piezometers are located within the Riverview estate. All piezometers decreased at an average of -1.22m in SWL.

North Western Sub Catchment (1)			
Increased	0	3	Decreased
Average	-	-1.22	Average
Maximum	-	-1.91	Maximum
Minimum	-	-0.31	Minimum

### Far Western Sub-catchment

Ten piezometers are located in the Far Western Sub-catchment. Of these piezometers, four decreased in SWL with two piezometers increasing throughout the reporting period.

Far Western Sub catchment (2)			
Increased	2	4	Decreased
Average	0.50	-0.52	Average
Maximum	0.65	-0.97	Maximum
Minimum	0.36	-0.21	Minimum

### Western Sub-catchment

Of the forty-one piezometers measured within the Western Sub-catchment, twenty-six decreased in SWL, with nine remaining dry for the 2017/18 reporting period, and five increasing.

Western Sub-Catchment (3)			
Increased	5	26	Decreased
Average	1.16	-0.88	Average
Maximum	2.30	-2.37	Maximum
Minimum	0.52	-0.06	Minimum

Average SWL for increasing piezometers within the Western Sub-catchment were 1.16m, ranging from 0.52m to 2.30m. The highest SWL increase was found in Red Hill Rd, Glenfield.

Twenty-six piezometers showed an average decrease over the reporting period, ranging from -0.06m to -2.37m, at an average of -0.88m. Highest decreases were found at Anderson Oval, Tolland.

### **CBD Sub-catchment**

The CBD Sub-catchment is greatly influenced by the management of the dewatering bore scheme in the Intensive Borefield. High average increases and decreases in SWL of piezometers within close proximity of the Intensive Borefield can be correlated to the dewatering bore operations.

Of the forty CBD Sub-catchment piezometers, twenty-two (55%) showed decreasing SWL, five revealed increasing SWL (12%) and thirteen (32%) remained dry over the 2017/18 reporting period.

CBD Sub Catchment (4)			
Increased	5	22	Decreased
Average	0.31	-1.30	Average
Maximum	0.65	-2.66	Maximum
Minimum	0.12	-0.06	Minimum

Average SWL decreases of -1.30m were reported across twenty-two water-bearing piezometers within the CBD Sub-catchment during the 2017/18 reporting period. Maximum decrease of -2.66m was recorded at the deep piezometer no. 71 in 1 Roma St, Central Wagga.

Five piezometers revealed an average increase of 0.31m in SWL with piezometer no.59 in 51 Chaston St, Central Wagga Wagga Wagga High School, Turvey Park showing a maximum increase of 0.65m at an average SWL of 2.90m below the surface.

The average SWL for 2017/18 in CBD Sub-catchment water bearing piezometers is 9.07m. This figure represents a decrease in SWL of 1.47m when compared to the 2016/17 reporting period average of 7.60m.

### Eastern CBD Sub-catchment

Limited piezometers are situated in the Eastern CBD sub-catchment. Of the three piezometers monitored, two decreased at an average SWL of 0.50m, and one remained dry.

Eastern CBD Sub-Catchment (5)			
Increased	0	2	Decreased
Average	-	-0.50	Average
Maximum	-	-0.56	Maximum
Minimum	-	-0.45	Minimum

### Far eastern CBD Sub-catchment

As a small sub-catchment minimal data on the SWL is available for the far eastern CBD piezometer category. Two water-bearing piezometers showed an average decrease in SWL of -0.17m with average SWL's of 13.18m. One piezometer remained dry.

Far Eastern CBD Sub-Catchment (6)			
Increased	0	2	Decreased
Average	-	-0.17	Average
Maximum	-	-0.21	Maximum
Minimum	-	-0.13	Minimum

### Eastern Sub-catchment

The Eastern sub-catchment is the largest sub-catchment and contains 46 piezometers, the largest number of piezometers within a sub-catchment. The 2017/18 reporting period revealed a majority decrease in SWL. Nineteen (41%) of Eastern Sub-catchment piezometers showed a decrease in SWL, with six (13%) revealing an increase in SWL and seventeen (37%) remaining dry over the 2017/18 reporting period.

Eastern Sub-Catchment (7)			
Increased	6	19	Decreased
Average	0.52	-1.34	Average
Maximum	1.21	-6.28	Maximum
Minimum	0.06	-0.07	Minimum

Decreasing SWL piezometers within the Eastern sub-catchment ranged from 6.28m to 0.07m with an average decrease of 1.34m across nineteen piezometers. The highest SWL decrease

of 6.28m was found at the deep piezometer no. 23, located at Sacred Heart Primary School, Kooringal.

Increasing SWL piezometers within the Eastern sub-catchment ranged from 1.21m to 0.06m with an average increase of 0.52m across six piezometers. The highest SWL increase of 1.21m was found at the deep piezometer no. 98, Amaroo St, Kooringal.

**Far eastern Sub-catchment**

The far eastern sub-catchment covers the second largest area of all the sub-catchments, containing mainly larger rural residential landholdings. Coverage of piezometers in this sub-catchment is poor and may not be a true indication of the sub-catchment as a whole. Of the three piezometers located in the sub-catchment, two piezometers increased in SWL whilst none decreased in SWL, The remaining piezometer stayed dry during the reporting period.

Far Eastern Sub-Catchment (8)			
Increased	2	0	Decreased
Average	0.26	-	Average
Maximum	0.43	-	Maximum
Minimum	0.09	-	Minimum

Two piezometers (no.168 and 169) on Bakers Lane, Lake Albert showed marginal increases in a SWL depth of 7.10m and 6.47m respectively.

**Tarcutta/Humula**

Eight piezometers are located in the rural villages of Tarcutta and Humula. All but one piezometer decreased in SWL at an average of 2.13m, and one remaining dry. This is a complete reversal of SWL direction at Tarcutta/Humula piezometers compared to the previous year reporting.

Tarcutta-Humula (T/H)			
Increased	0	7	Decreased
Average	-	-2.28	Average
Maximum	-	-3.32	Maximum
Minimum	-	-2.28	Minimum

## 4.2 Groundwater Contour Mapping

During the 2014/15 reporting period Council engaged Catchment Simulation Solutions to provide a mechanism for Council for the production of ArcGIS groundwater contour maps based on measurements entered into a field based spreadsheet taken from the 200+ piezometers within the LGA.

This integrated system will allow Council to keep updating the piezometer the piezometer data directly into the spreadsheet and allow this information to be interpolated and mapped on demand.

The mapping system allows Council to map four different contours:

1. Groundwater table depth from surface (m)
2. Groundwater table depth in AHD (mAHD)
3. Electrical conductivity (EC)
4. Differences in groundwater table depth over different years/seasons.

Figure 6 shows the groundwater contour map of Western catchments of Wagga Wagga (Calvary, Turvey Park, Mount Austin, Ashmont, Glenfield, Lloyd) interpolated from piezometers measured in June 2018. Red areas indicate extremely shallow groundwater levels between 0 – 2m from surface level, orange areas show 2 – 4m from surface, green areas showing 4 – 10m from surface and purple areas show groundwater levels greater than 10m from surface. Numbers labelling piezometer points (black dots) show actual readings taken in the field on or before June 2018.

Figure 6: Groundwater contour map showing water table contour levels interpolated from piezometer readings taken in June 2018.

### 4.3 Critical Piezometers

Piezometers with both EC concentrations (>5 dS/m) and a high SWL (<5m) can indicate urban salinity concerns. The criteria of EC greater than 5 dS/m and SWL of less than 5 metres has been taken from the previous reports to maintain consistency of which piezometers and surrounding areas are most susceptible to urban salinity problems (Table 2).

**Table 2:** Critical piezometers, piezometers displaying high Standing Water Levels (<5.00m) and Electrical Conductivity (>5dS/m) in 2017/18.

Piezometer Number	Location	Urban Sub catchment	Piezometer Drill Depth (m)	Average SWL 2017/18 (m)	Average EC 2017/18 (dS/m)
9	South Campus, Turvey Park	3	4.3	-0.28	8.62
18	Nathan Park, Ashmont	2	11.0	-1.47	9.02
29	Dalkeith Ave, Lake Albert	7	10.0	-2.88	6.63
54	Derna Pl, Ashmont	2	3.0	-1.51	10.75
57	7 Mortimer Pl, Central Wagga	3	3.0	-0.58	13.55
89	31 Chaston St, Central Wagga	4	5.5	-3.24	9.90
90	51 Chaston St, Central Wagga	4	6.6	-2.90	8.18
147	South Campus, Turvey Park	3	3.3	-1.74	18.24

Eight piezometers (compared with eight in 2016/17, eleven in 2015/16 and nine in 2014/15) recorded both an EC greater than 5 dS/m and SWL of less than 5 metres in the reporting period. It should be noted that exactly the same piezometers existed in 2016/17, with SWL's in 2017/18 decreasing overall, however, not by enough to discharge it from less than 5.0m from the natural ground surface. Piezometers with these characteristics are critical and have the potential to cause extensive damage to the surrounding environment. The surrounds of piezometers in Table 2 are at risk from urban salinity due to their high standing water levels.

Five of the eight 'members' of the critical piezometer list are located in urban salinity 'hotspot' areas of CSU South Campus, Showgrounds and the Calvary Hospital area (CBD sub catchments 3 and 4). Piezometers no. 18 and 54 are located in the Ashmont area of the far Western Sub catchment. Standing water levels of piezometer no. 29 (located at Dalkeith Ave, Lake Albert) may be high due to lateral influences of Lake Albert. This piezometer has decreased by 0.58m on average over the reporting period, which is similar to the decrease in Lake Albert's depth, mainly through evaporation.

Critical piezometers provide valuable data on target areas for remediation action. The severity within these critical areas especially in area noted for high salinity levels is concerning for urban salinity management in Wagga Wagga.

## 4.4 Dewatering Bores

The dewatering bores of the Intensive borefield are monitored monthly allowing for the volume of water and amount of salt discharged to the Murrumbidgee River to be calculated (Table 3). Groundwater from the Intensive Borefield is pumped to the Murrumbidgee River via a pump station adjacent to the intersection of the Sturt Highway and Moorong Street.

**Table 3:** Intensive Borefield salt load calculations for July 2017 – June 2018.

Bore number	Bore Location	Volume Pumped (m3)	Pump Hours	Average EC (dS/m)	Salt Discharged (tonnes)
1	Emblen Park	-	5.41	-	-
2	Meurant - Emblen roundabout	0.27	0.33	2.29	0.00
3	19 Sullivan Ave	4,809.36	4462.26	2.36	7.26
4	3 Cullen Rd	27,594.31	4,141.04	1.30	23.04
5	Calvary Hospital Carpark	50,967.79	9,287.38	2.16	70.36
6	Docker St - Meurant Ave	-	-	-	-
7	9 Hardy Ave	19,836.34	9,269.57	3.16	40.08
8	25 Gormly Ave	24,473.51	9,287.00	2.88	45.13
10	Chaston St - Foxborough Ave	-	-	-	-
	<b>Total</b>	127,681.58	36,452.99		185.87
	<b>Average (per bore)</b>	15,960.20	4,556.62	2.36	23.23
	<b>Average (per day)</b>	349.81	99.87		0.51

A daily average of 349.81 cubic metres (349,810 litres) of groundwater from nine dewatering bores was pumped into WWCC's stormwater system during 2016/17 (an increase from 325,090 litres in 2016/17). Based on EC readings, this volume represents average daily discharges of 0.51 tonnes (510kg) of salt from groundwater aquifers below the Calvary Hospital precinct (up from 450kg in 2016/17).

At present, Wagga Wagga City discharges this saline water to the river. Investments in revegetation, rear of block drainage and education programs are considered by Council as sufficient offsets to permit the discharge of moderately saline water.

## **5. DISCLAIMER**

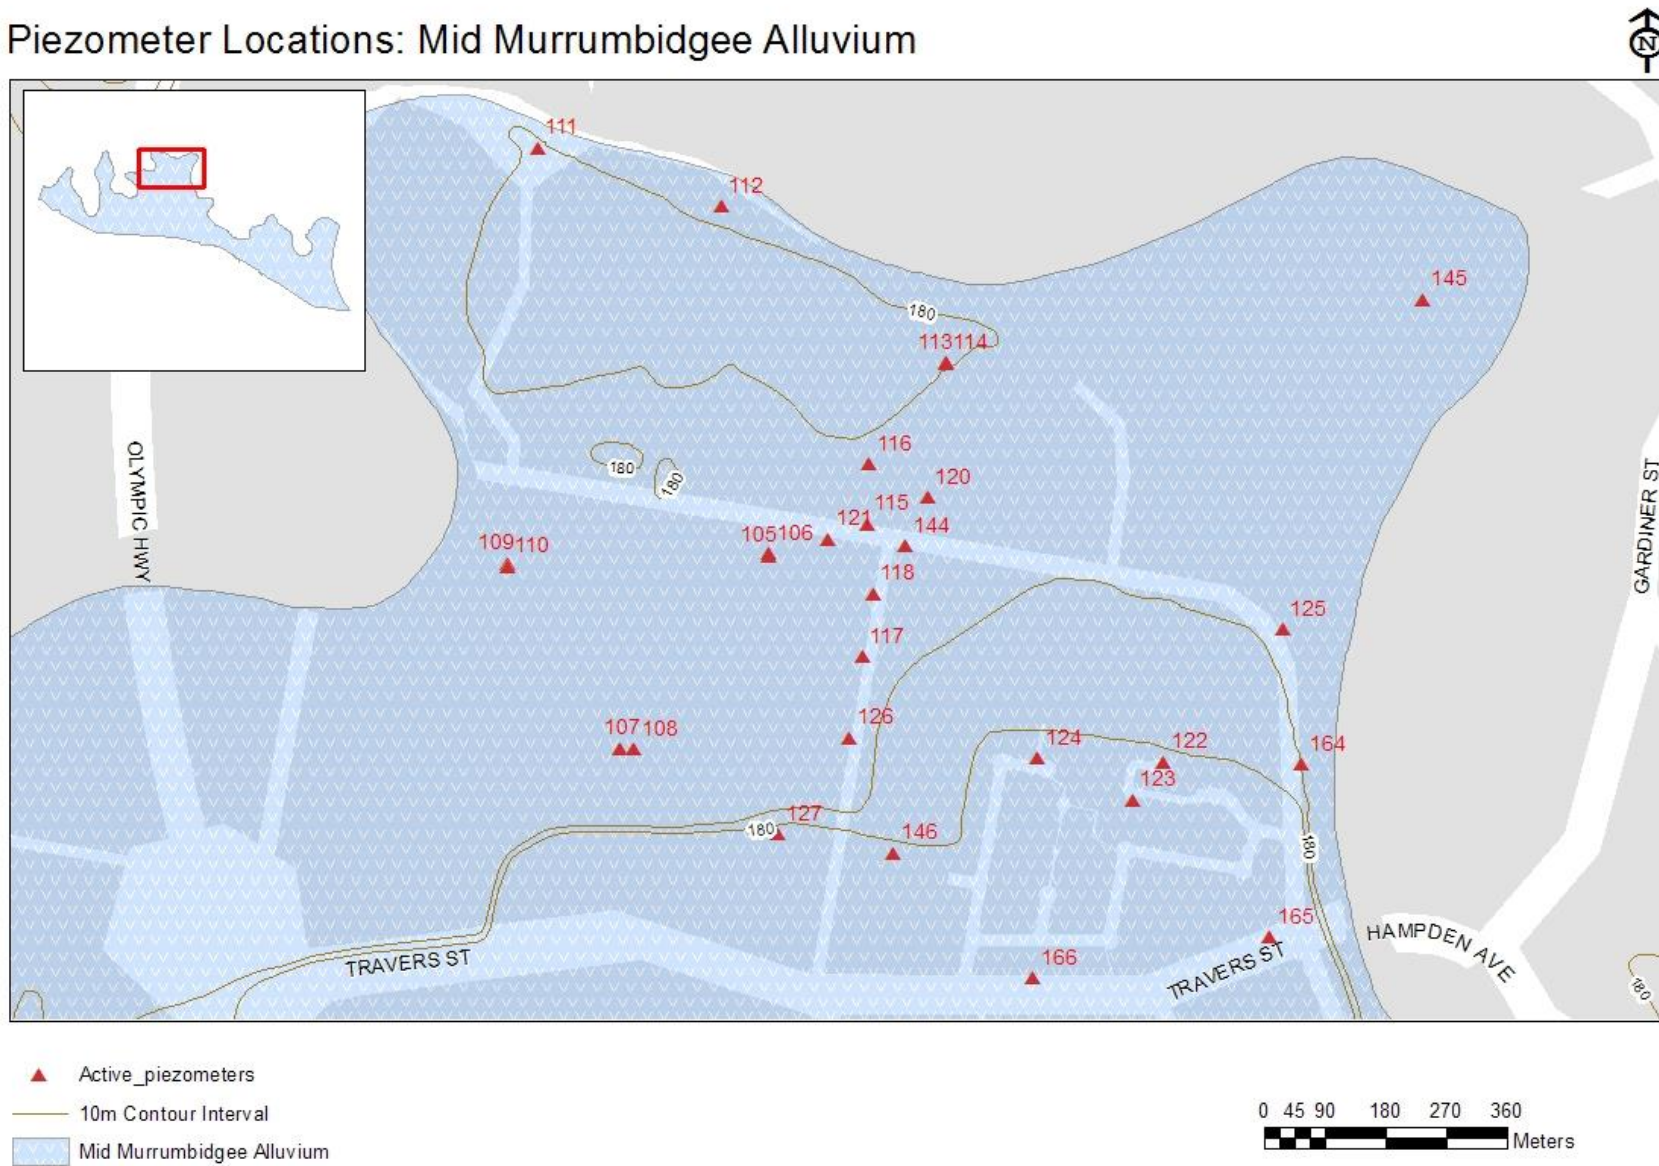

This report has been compiled by Wagga Wagga City Council's Department of Environmental & Community Services exercising all due care and attention. Council does not accept any responsibility for any inaccurate or incomplete information supplied by third parties. No representation is made as to the accuracy, completeness or suitability for any particular purpose of the source material included in this report.
